

Code42 Security Center

Automatically detect security risks & respond quickly

While most news stories about hacking focus on malicious threats outside the enterprise, there is growing evidence that insiders pose equal or greater risks to your data. After all, people with credentials who work within your walls tend to have a good understanding of what information is available, what it's worth and how it's protected. This makes it difficult for enterprises like yours to protect against a variety of scenarios, such as a terminated employee transporting valuable data out the door or disgruntled employees looking to turn a profit—or just inflict damage—by sending files to your competitors. Mitigating these threats requires innovative new tools, like Code42 Security Center.

The power to detect unusual user behaviors and act quickly

To compete, you must provide employees with access to data and fully enable your mobile workers. With Code42 Security Center, you can empower your people while proactively protecting your data. Security Center is a powerful web app that allows you to create activity profiles for your users. If an anomaly in data trends is detected—such as exceptionally large downloads to removable media or cloud storage folders—Security Center sends an email alert. You then have the option of instantly and remotely locking the employee's device via the Access Lock* feature.

You can quickly and easily change a user's profile based on employment status and other critical considerations. If an employee is in the process of being terminated or leaving for a job outside your enterprise, you can change monitoring criteria. You can also define security thresholds and determine which events will trigger an email notification.

Security Center gives you the power to monitor and protect your data:

- ▶ Create activity profiles to monitor users
- ▶ Set thresholds to trigger email alerts
- ▶ Focus on data exfiltration to removable media and cloud storage folders
- ▶ View activity summaries for users who trigger alerts—pattern matching, file management and usage of cloud service or removable media
- ▶ Remotely lock devices in the event of a security concern
- ▶ Integrate data forensics and content inspection into your security processes

Report Name	Date Modified	Total Number of Users
Departing Employees	08/04/2016	35
Notable Employees	07/21/2016	18
Project Alpha Team	07/13/2016	5
IR Tracking	06/28/2016	12

Departing Employee profile and Activity Notifications

Automatically detect security risks & respond quickly

Security Center provides a seamless security solution because the Code42 multi-purpose agent silently and continuously protects your endpoint data. This means you have the ability to track file activity on endpoints and know the full history of data on a specific device. In a future update, you will gain the ability to monitor data as it progresses through an organization.

You also have the ability to instantly lock any device—and unlock it just as quickly in the event that there is no security concern. This is especially helpful when devices are recovered after being reported lost or stolen.

Value of an automated process

- ▶ Traditional processes require human intervention—awareness that an employee has departed and taken data.
- ▶ Security Center automates the process and conducts comprehensive discovery activities before the employee leaves the enterprise.
- ▶ Backed-up devices—including employee's personal devices in a BYOD workplace—can be locked until data is returned and/or devices are inspected.
- ▶ Traditional discovery and recovery processes can take up to 60+ days. Security Center can drastically shorten this process.

CONTINUED INVESTMENT IN NEW CAPABILITIES

Security Center leverages the industry's most advanced profiling, detection and remote locking technologies. Code42 is committed to investing in this powerful web app and is developing new machine learning capabilities to ensure our customers stay ahead of evolving data security threats.

*Access Lock is available for Windows devices only at this time.
